

S421 Light Fabric Transfer Paper

How it works:

Start with a white or light colored sub-strate to transfer on. This can be any of the fabrics or alternative substrates that work with light transfer products. You will need a hand iron, ink jet printer, scissors and a hard, smooth surface.

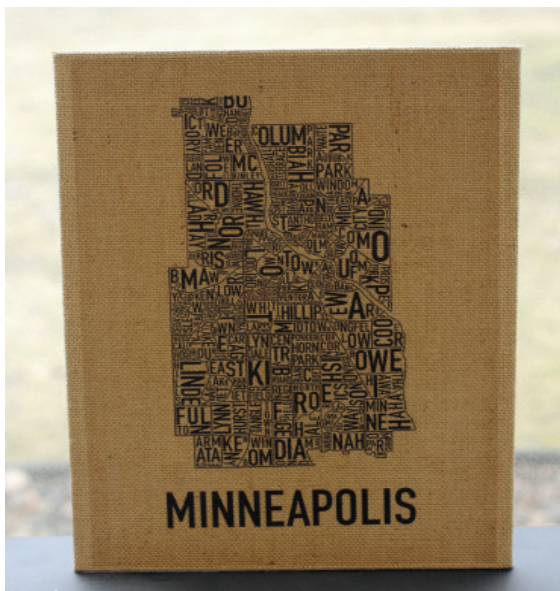

Mirror or flip your image - then print on an inkjet printer!

Cut around printed area of transfer and place face down on the substrate. Iron transfer paper according to instructions.

Peel the paper off of the substrate while it is still HOT for a beautiful, crisp transfer.

Get great results every time like this burlap sign. The process is simple and works the same way for all substrates! The possibilities are endless!
